

Narrative Summary: Recommendation: short NCLH at \$15.05, starting at a third of a full position. Our base case is worth about \$10.80 (~28%) and the probability-weighted value about \$11.90 (~21%). The market prices NCLH on net yield (ticket and onboard revenue, less commissions and onboard costs, per available berth-day), and the share price assumes net yield climbs back above its 2025 level. We think it falls again in 2027, for two reasons. First, NCL is losing the Caribbean to Royal Caribbean and Carnival, whose private islands and ships fill at full price, so NCL has to fill its ships by cutting fares; this is competition, not the war, and its own new island and ships have not fixed it. Our scrape of 4,783 itineraries from a public fare tracker shows NCL's 1H27 Caribbean fares down 14.5% while its rivals hold theirs, which lowers ticket price per passenger day. Second, NCL's Best Price Guarantee gives guests no reason to book early, so management's plan to rebuild prices by selling cabins early will not work. NCL's deposits, from its SEC filings, already show the booking shortfall, and since COVID deposits have reached net yield about four quarters later; that lowers 2027 occupancy and keeps 2H27 prices down. Our 2027 EBITDA of \$2.47B is \$221M below the Street's \$2.69B, and these two reasons account for almost all of the gap. Our EPS is \$0.95; consensus of \$1.46-1.67 is further off because it has not absorbed the September interest guide.

Company Overview: NCLH runs 35 ships with about 75,000 berths: Norwegian Cruise Line (NCL), the mass-market brand with about 83% of berths, plus the upper-premium Oceania and luxury Regent brands. In 2025 it earned \$9.8B of revenue, \$2.73B of adjusted EBITDA and \$2.11 of EPS, and it carries \$14.8B of net debt, two-thirds of enterprise value. The debt is why small changes in net yield move the equity: each 1% is about \$75M of EBITDA and 9% of the share price. Then 2026 went badly. NCL added about 40% more Caribbean capacity before its Great Stirrup Cay upgrade was ready, the Iran war pushed oil above \$100, and guidance fell from flat net yield and \$2.38 of EPS in March to about -5% and \$1.50 in July. In February John Chidsey replaced Harry Sommer as CEO, under a cooperation agreement with Elliott, a holder of more than 10%.

Industry Overview: Carnival (about 32% of capacity), Royal Caribbean (26%), MSC and NCLH (about 10% each) carry about 80% of the market. Demand is healthy overall: Carnival's deposits are up 6.5% on flat capacity and Royal's are up 5.6%. The competition is in the Caribbean, where each large line now sells a private island, and NCL arrived with the most new capacity and the last island to be finished (September 2026). NCLH's strengths are luxury brands that are not cutting price and one of the youngest fleets; its weaknesses are the most debt of the three (5.4x EBITDA), the weakest Caribbean product and a new CEO after two guidance cuts. 2025 return on capital was about 10%, against 16% at Royal and 12% at Carnival.

Market Expectations: Since 2024 NCLH's EV/EBITDA has tracked net yield growth closely ($r = 0.87$ over ten quarters), and on the four days management changed its yield outlook the stock lost 27 points against Royal and Carnival. Working back from the \$21.7B enterprise value at a 9% WACC, the price needs about \$3.0B of steady-state EBITDA, which is management's March guide and net yield back above its 2025 level (Exhibit 1). The Street is less demanding but still expects a recovery: it models 2027 revenue of \$10.6B and EBITDA of \$2.69B, and the \$18.80 average target needs \$2.9B. Since net yield is occupancy times revenue per passenger day, the debate comes down to two drivers: ticket price per passenger day, which the consensus case has stabilizing, and occupancy, which it has recovering by a point in 2027. Each thesis goes against one of them.

Sentiment has turned faster than estimates. Ratings are 4 Buy, 15 Hold, 0 Sell and short interest is 20.7% of float, yet consensus 2027 EPS moved only two cents when NCLH guided 2027 interest \$0.35 a share higher on September 30; at the Street's own EBITDA and the guided interest, EPS is about \$1.41. The bull argument is that the selloff was oil and the sector. Our regression puts 54% of the decline there, but NCLH moved no more than Carnival on the biggest oil days, and the NCL-specific 46% came on six company news days and did not reverse.

Thesis 1: NCL is cutting prices because it is losing share in the Caribbean, which keeps ticket price per passenger day falling. The Street reads the discounting as a result of the war and of execution problems that the finished island and new ships will fix in 2027. We think the cause is competition. Every large line added Caribbean ships and a private island at the same time, and because a ship costs about the same to sail full or empty, the line with the weakest product fills its ships by cutting price. The fare data fits that. On October 2 we compared the lowest fare on 4,783 itineraries with each one's 90-day average. NCL has cut 1H27 Caribbean sailings by a median 14.5% but Europe by only 2%, although two-thirds of its European guests fly in and face higher airfares. Royal and Carnival, which also added Caribbean ships, have held Caribbean prices and are discounting Europe instead (Exhibit 2). If the war were the cause, we would expect the opposite pattern. The cuts are also recent. NCL cut prices less often than Royal in 2025, but it went from 1 to 9 of the industry's 10 largest monthly price cuts between December and October. The new product has not stopped them: sailings that call at NCL's island are cut as much as its other Caribbean sailings, and its newest ships are cut 22% against 1% for Royal's newest. NCL now prices below the budget brand: from Port Canaveral in 1H27 its lowest fare is \$94 a night against \$100 at Carnival. Oceania and Regent show no cuts, so the problem is the NCL brand.

In the model: lowest fares are not realized prices, but realized prices are moving the same way (NCLH's ticket revenue per passenger day fell 5.6% in 1H26), and the cuts matter only for cabins NCL has not yet sold. With a normal booking curve and the booking shortfall from Thesis 2, about 45% of 1Q27 and 55% of 2Q27 cabins are still unsold, and 74% of NCL-brand capacity sails in the Caribbean in 1Q27. We weight the NCL brand at 65% of ticket revenue: if Oceania and Regent sell near their lowest fares, as all-suite ships tend to, NCL must make up about 66% of the \$265 of ticket revenue per passenger day NCLH reported for 2025. That takes 1H27 ticket price to -2.6% y/y against -1.1% in the consensus case. The same data, with Q4 sailings cut 36%, puts 4Q26 net yield at -7.0%, half a point below the implied guide. The main risk is that the cuts reverse before guests book; we re-run the fare panel monthly.

Thesis 2: NCL's booking shortfall is already in its deposits and reaches net yield about a year later, which holds down occupancy. The consensus case has net yield up about 3% in 2H27, helped by easy comparisons and by base-loading, which Zacks expects to "maximize yield across the full booking cycle while maintaining pricing integrity": opening sailings at lower fares and raising them as ships fill. That needs guests who book early because they expect prices to rise. NCL's Best Price Guarantee removes the reason to: before final payment a booked guest can move to any lower

Exhibit 1: Adjusted EBITDA (\$B)

Exhibit 2: Fare change, 1H27 sailings (%)

fare, and after it a guest on a cruise of six nights or more gets an upgrade or future-cruise credit for the difference, while Royal offers nothing after final payment. NCL has also shown guests that it cuts late: 77% of its 4Q26 Caribbean sailings of seven nights or more have been cut 20% or more. Filling ships late with price has costs beyond the fare: in 1Q26 occupancy rose 2.3 points, but net yield still fell 1.0% and onboard revenue per passenger day fell 2.9%, because guests who buy on discount spend less on board.

The shortfall is already visible. Deposits per future berth-day are down 8.3% y/y, the seventh decline in a row, while Royal's and Carnival's are growing, and NCL says it is "below its optimal booked position for the next 12 months." This is not a shift to shorter cruises, which book later: about a third of 4Q26 Caribbean itineraries are 3–5 nights at NCL, Royal and Carnival alike. The lag from deposits to net yield is also predictable. Guests pay deposits when they book, so deposits move first. Before COVID the lead was one to two quarters. Since COVID guests book further ahead (advance ticket sales are about a third of annual revenue, against a quarter in 2016–18), and the lead has stretched to about four quarters: deposits turned negative in December 2024 and net yield followed in 1Q26. At a four-quarter lead the indicator has called the direction of net yield in 5 of 6 reported quarters, and the 3Q26 guide and 4Q26 implied figure fit as well (Exhibit 3). On that lag, the March and June readings fall on 1Q27 and 2Q27, the quarters consensus expects to recover. A simple fit over those eight quarters points to 1H27 net yield of about –4%, against –2.6% in our model and –0.2% in the consensus case.

Exhibit 3: Deposits vs. net yield (% y/y)

In the model, we size the shortfall from deposits: if booked fares fell as much as realized fares, about 3 points fewer cabins are booked; if booked fares were flat, about 8. We use 5. We assume 20% of those cabins sail empty, about half of what the 2026 link between deposits and occupancy implies, and the rest sell late at NCL's current close-in discount of about 25%. That puts 2027 occupancy at 102.1%, a point below the consensus case, takes about 0.9 points off 2H27 ticket price and holds onboard spending growth to 2% against 3.5% (it fell 0.3% in 2025 and rose about 1% in 1H26).

From the data to the model: Each thesis moves one driver of our quarterly net yield build (net yield = occupancy × revenue per passenger day): the fare panel sets the price cut on unsold cabins, and deposits set the booking shortfall, which shows up as empty cabins and late discounts. Our consensus case reproduces the Street's 2027 revenue (\$10.6B) and, at run-rate unit costs, its EBITDA (\$2.68B against \$2.69B). We use the same costs, so the whole \$208M gap to our \$2.47B comes from the two theses (Exhibit 4). Consensus EPS needs more: unit costs falling 0.5% in 2027, worth another \$107M.

Exhibit 4: 2027 EBITDA, consensus case to ours (\$M)

Alternative data → model input	Consensus case	Ours	EBITDA (\$M)
Fare panel → 4Q26 net yield (exit rate)	–6.0%	–7.0%	–29
Fare panel → 1H27 ticket price y/y	–1.1%	–2.6%	–44
Deposits → 2H27 ticket price y/y	+0.3%	–0.6%	–17
Deposits → 2027 occupancy	103.1%	102.1%	–76
Both → onboard spend per guest y/y	+3.5%	+2.0%	–42
2027 EBITDA (run-rate unit costs in both)	\$2.68B	\$2.47B	–208

Valuation and risk/reward: We value NCLH on 2027 EBITDA at today's 8.5x forward multiple, less \$15.9B of year-end net debt. Our \$2.47B gives \$10.82 a share (–28%), and a DCF of 2027–30 cash flows gives \$8.26. Each point of 2027 ticket price is worth about \$0.90 a share and each point of occupancy about \$1.40. If consensus EPS is right (Street revenue plus falling unit costs) and the stock re-rates to 9x, it is worth about \$19.70 (+31%); if discounting spreads into 2H27, about \$6.20 (–59%). Weighted 25/50/25, value is about \$11.90 (–21%). The multiple is the main valuation risk: at 9.0x our EBITDA is worth about \$13.70 (–9%). We use today's because NCLH's multiple has fallen with net yield (10.0x to 8.7x from September 2025 to March 2026). If cost savings let unit costs fall 0.5%, value rises to about \$12.80 (–15%).

Scenario	Prob.	2027 net yield	2027 EBITDA	EV / EBITDA	Value	vs. \$15.05
Bull: consensus EPS is right and the stock re-rates	25%	+1.6%	\$2.79B	9.0x	\$19.74	+31%
Base: our view	50%	–0.7%	\$2.47B	8.5x	\$10.82	–28%
Bear: discounting spreads into 2H27	25%	–2.6%	\$2.22B	8.5x	\$6.24	–59%
Probability-weighted					\$11.90	–21%

Catalysts and when we would cover: November 4 (3Q26): earnings should beat (\$0.90 guided against \$0.83), but those cruises were sold before the cuts; the number to watch is September 30 advance ticket sales, which we expect at \$2.94B (–7% y/y). Late February: the first 2027 guide, which we expect at or below flat net yield against +1.6% in the consensus case. May 2027: 1Q27 results (we model occupancy of 101.8%, ticket price –2.8%). We would cover on the data, whatever the price: advance ticket sales of \$3.11B or more, a fare-panel re-run showing NCL's 1H27 Caribbean cuts back near peers', or a 2027 guide above +1%.

Risks and sizing: The main risk is a squeeze. 95M shares are short (5.7 days to cover), and the stock rose 48% in six weeks this spring when oil fell. About half of NCLH's moves follow oil and its peers, so we would start with a third of the position, add on oil- or ceasefire-driven rallies and around November 4 and February, hold part of it in puts, and stop out above \$19, where shorts added at about \$18 are under water and the bull case begins. Elliott could push for a sale, though net debt above 5x EBITDA makes a buyout hard to finance. We could also be early on timing.
